

## TruckSense - *Trucker's Sixth Sense*

TruckSense is a service built to prevent accidents and other dangerous situations on the road. Designed for truck drivers. Worry-free trucking!

### Introduction

We already have many different services that are used to call for help when a road accident happens. We also have some technologies that try to prevent accidents by emergency braking when an obstacle is in front of us. But there still aren't many services that would make traffic more predictable by sending alert to drivers that are coming towards a location where something happened. Because of that, there are accidents where many cars rear-end each other. TruckSense is trying to prevent just that. Because trucks have the longest braking distance they are the most endangered in these types of situations and the main goal of TruckSense is to help them by creating more predictable and smooth traffic for them. If they would be notified in a timely manner they would have a lot of time to reduce the speed some accidents could be prevented and their job would be less stressful.

Our goal is to provide a predictable and safe trucking experience.
